

The authored room library

WHAT THIS IS

Four large rooms, thirty renders, and what I think you should do about each one. Every picture is an actual shipped render straight out of the build -- nothing redrawn, recomposed or cropped to flatter a room.

THE FOUR ROOMS

Hall (the P3 room, reviewed once already and repaired twice since), then Wave 1: **Plenum**, a 72 m shaft; **Yard**, an 84 m field; **Span**, a 90 m bridge over a walkable basin. Three proportions on purpose -- tall, wide, long -- so the library cannot become one room built three times.

WHERE THIS STANDS

All four rooms now have your form verdict, and the two changes you asked for on the Hall have landed. This edition records what was decided and what it changed. All four still ship as *review: pending* and Art never writes *pass* -- a form verdict is not a review state, and Production has still to recertify the Hall's changed contract.

STATE

Built and measured on branch claude/archipepsi-art. The Hall's three staircases were rebuilt after Production's capsule audit refused two of them -- pages S1 to S4 -- and Production then certified that geometry at **fc2cc41**: structural 0, measured 0, mandatory circulation clean. Your two changes went in after that.

BEFORE YOU SCROLL

How to read this

ONE PICTURE PER PAGE

Each render fills the width of the page, with the notes for that exact picture underneath it. Pinch to zoom -- the images are 1400 px wide, so there is roughly three times more detail in them than a phone shows at first fit.

THE VOCABULARY, IN PLAIN TERMS

A **stand surface** is somewhere the game promises you can stand. A **route segment** is a declared way of getting from one to another; *walk* means there is continuous ground, *drop* means you fall on purpose. An **offer** is a place reserved for a movement mechanic -- a rail to ride, a pad to launch from, an anchor to grapple. Art reserves the place. Production decides what the mechanic does there.

WHAT ART NEVER AUTHORS

No trajectories, no velocities, no arcs. The launch pages draw two pads and deliberately nothing between them, because the solver derives the flight from the pads and gravity -- and the first time a drawn curve disagreed with it, the drawing is what everyone would remember. No enemies are placed and no encounter is authored either.

COLOUR

Where I have written a recommendation, **green is approve as-is** and **orange is something I want changed or decided**.

What you passed

ALL FOUR ROOM SHAPES -- PASSED

The three Wave 1 proportions are genuinely different rooms and not one idea stretched three ways: you arrive at the top of the Plenum and the whole room is the way down; you cross the Yard and never have to climb at all; you walk the Span twice at two heights. Strip out every enemy, pickup and decoration and you would still know which is which from the silhouette alone. The Hall still reads as it did at P3.

THE STAIRCASE REPAIR -- CERTIFIED AT `fc2cc41`

Production refused two of the Hall's three climbs on the real player capsule. The cause was one missing coordinate conversion in the shared helper, so the Wave 1 rooms had it too. All nineteen flights in the library now measure a worst real step of 0.89 m against a 1.00 m limit, taken from the collision triangles rather than from bounding boxes. The Hall's declared contract did not change by a single field.

THE OFFER GRAMMAR -- NOW IN ALL FOUR ROOMS

Each Wave 1 room declares one rail, one launch pair and three grapple anchors. The Hall was the odd one out and is not any more: it has the same three-part vocabulary now. That is the house pattern for the remaining six rooms.

TWO PROPORTION DECISIONS, ON THE RECORD

The Yard keeps its ~16 m height -- the horizontal contrast is wanted, and Wave 2 may lean on it. **The Span keeps its one-way mid-span drop** -- free descent, costly ascent, deliberate. Both were questions I could not answer alone and both are now settled.

The two Hall changes, and what they did

1. THREE GRAPPLE POINTS -- DONE

One at the inner lip of each collar ring, at heights 9.2, 19.2 and 27.2, each with the basin as its ground. They make a ladder up the landmark. **They moved once during the work and the reason is worth keeping:** tucked under a band they were legal and completely invisible, because a solid band hides what hangs beneath it from every angle but one. A grapple point the player cannot see is not an opportunity. At the lip they read from the floor, from the collar and from across the shaft -- page O5.

2. THE COLLAR LOOP -- CLOSED

One optional walking segment, from 5.0, 21.0, 27.0 to 7.5, 21.0, 29.0. **It needed no geometry at all.** The band was never a C -- the east band already spanned the south-east corner -- so only the declaration was missing. You can circle the landmark now. Page O2.

WHAT THE HALL KEPT

Everything the verdict asked to preserve: the flat-tread flights, the plinths as geometry rather than stand surfaces, the rail, the launch pair, the open central vertical reservation. **The shell exported byte-identical** -- both changes are declarations, so no geometry moved and the entry sightline still measures 64.7 m. Twelve stand surfaces, unchanged; traversal 11 to 12; offers 3 to 6; 71 collision pieces, unchanged.

AND HOW THE ANCHORS WERE CHECKED

Art now mirrors Production's grapple rule at build time -- anchor clear, four metres of air beneath it, ground within thirty below -- reading both constants from Production's own file rather than retyping them. It was calibrated before it was trusted: all nine of Wave 1's already-certified anchors pass, and it refuses an anchor buried in the Yard's crane, one a metre over the floor, and one outside the room. **RoomAudit remains the authority.**

WHAT IS STILL OPEN

All four rooms stay *pending*, and Production has still to recertify the Hall against the changed contract -- three new offers and one new segment. **Wave 2 has not started** and is not authorised by these verdicts.

Hall

SIZE

41.2 x 60.0 x 39.6 m

DECLARED

12 stand surfaces, 12 route segments (walk), 71 collision pieces

RAIL

11 control points, 143.9 m, y 2.0 to 31.5

LAUNCH

one pair, 24.5 m apart

GRAPPLE

3 anchor points

WHAT MAKES THIS ROOM DIFFERENT

The landmark in the middle is a FRAME, not a solid. A solid block would have been the easier sculpture, and it would sit exactly on the one line the room needs you to see -- the exit, 60 m away and 28 m up, visible from the doorway. So the landmark is four columns and three rings around a 12 m open shaft, and that sightline is checked at build time across 64.7 m; the build fails if anything gets in the way. The rings still hide the west gallery from the door, so the room keeps revealing pieces of itself as you cross it. Four occupied heights: floor 0, west gallery 11, the ring-and-gantry band at 21, exit at 28, roof at 38.

THE INTENDED ROUTE

In at floor level, out onto the basin, west stair up to the gallery at 11, a second stair up the back wall to the north landing at 21, across a bridge onto the collar around the landmark, round it to the east side, across a second bridge onto the gantry, then a last stair up to the exit at 28. Every metre of that is on foot with no movement gear installed -- which is the condition the offers below are allowed to exist under.

RAIL, LAUNCH AND GRAPPLE

A rail that climbs from head height to 31.5 m, twice around the landmark. A launch pair that skips the whole middle of the route: a pad on the basin floor aimed at the east gantry 24.5 m away, so a player with the launch package trades the two stairs and the collar walk for one jump. And three grapple anchors, added on the owner's verdict -- one at the inner lip of each collar ring, at 9.2, 19.2 and 27.2, with the basin as the ground under all three.

WHAT I THINK WE SHOULD DO

Approve -- and both changes are in. Production certified the repaired geometry at fc2cc41, the owner passed the form subject to two changes, and both have landed as declarations: three grapple anchors on the collar rings, and one optional segment closing the collar walk from a C into a loop. The shell exported byte-identical, so nothing you reviewed has moved. It stays review: pending until Production recertifies the new contract.

HALL / VIEW 1 OF 18

Inside the door

WHERE YOU ARE

At floor level, three metres inside the only door, looking down the 60 m length of the room.

WHAT YOU ARE LOOKING AT

A 10 x 9 x 5.5 m vestibule opening straight onto the full hall. The small space comes first deliberately: scale is a comparison, so you are given the small term before the big one. Dead ahead is the landmark -- four columns and three rings around an open shaft.

THE ROUTE

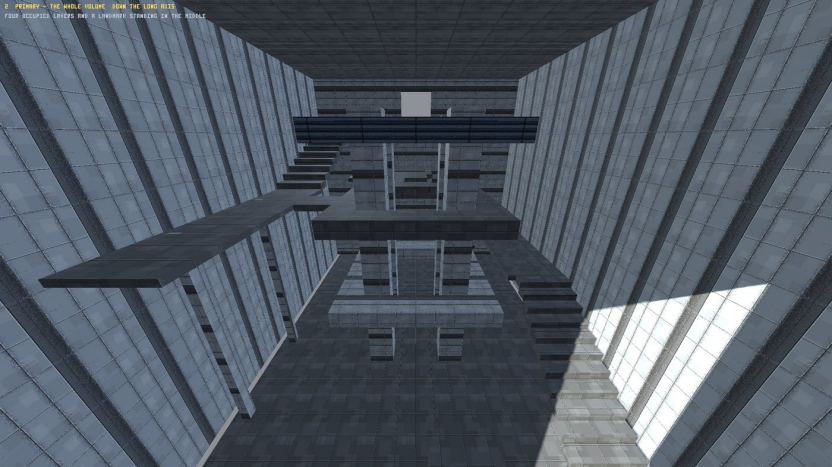

Everything starts here. Out onto the basin, then left to the first stair.

OFFERS

None reach you here. The launch pad is out on the basin floor ahead and to the right.

MY CALL

Approve. This is the first read the P3 direction asked for, and it survived both repairs unchanged.

HALL / VIEW 2 OF 18

The whole volume

WHERE YOU ARE

26 m up near the entry end -- not a place you can stand, a camera placed to show the room at once.

WHAT YOU ARE LOOKING AT

All four occupied heights in one frame, with the roof 38 m up. About 91,000 cubic metres, roughly forty times the largest of the earlier small rooms.

THE ROUTE

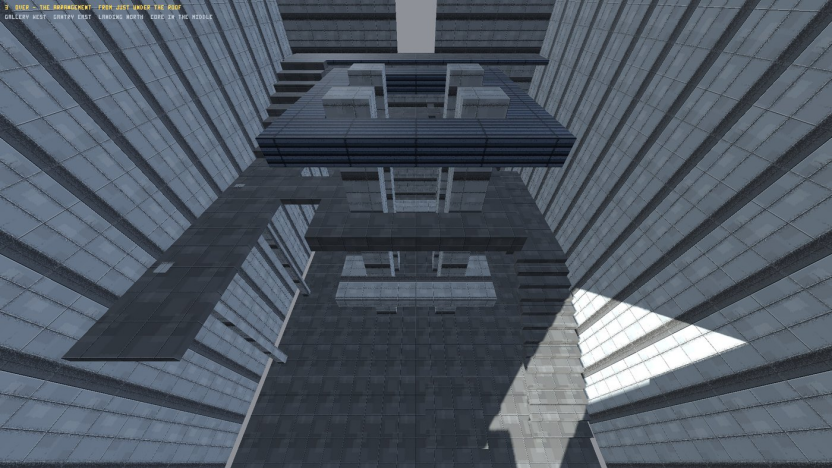

The entire climb is visible here: west stair, back stair, the collar around the landmark, the gantry, and the last stair to the exit.

OFFERS

The rail crosses the upper third of the frame, twice around the landmark, ending at 31.5 m.

MY CALL

Approve. If you only look at two pages, this and the next one are the two.

HALL / VIEW 3 OF 18

The arrangement, from under the roof

WHERE YOU ARE

33 m up, five metres below the ceiling, looking down the room.

WHAT YOU ARE LOOKING AT

The plan. The landmark sits in the middle and everything else is arranged around it rather than beside it, which is what stops the room reading as one big rectangle with things in it.

THE ROUTE

From up here the route reads as a spiral: up the west side, across the back, around the collar, out the east side and up.

OFFERS

The rail's two turns around the landmark are clearest from this angle.

MY CALL

Approve. This is the view that answers 'several local spaces or one big hall'. It is several.

HALL / VIEW 4 OF 18

On the floor, beside the landmark

WHERE YOU ARE

Standing on the basin floor, 13 m west of centre, a third of the way into the room.

WHAT YOU ARE LOOKING AT

The landmark from underneath, at its full 30 m. This is the scale contrast the room is built around -- the same structure that read as a frame from above reads as a wall of machinery from down here.

THE ROUTE

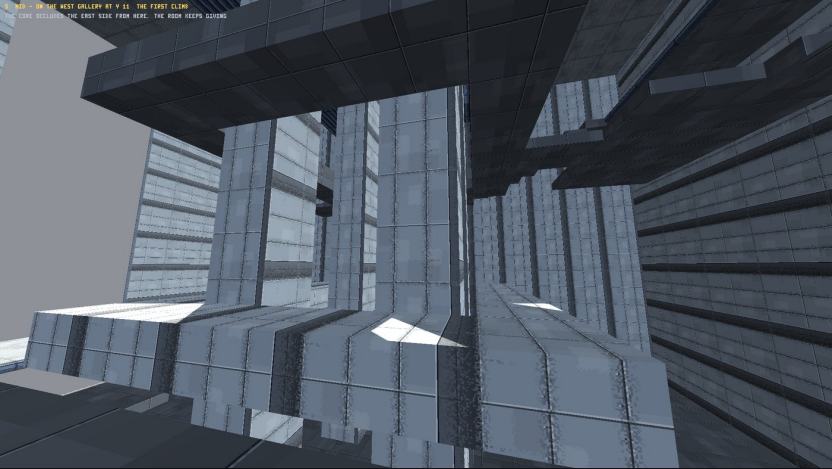

This floor is the retreat space: one continuous surface under the entire room, shaft included.

OFFERS

The launch pad is on this floor. The shaft overhead is reserved for vertical movement.

MY CALL

Approve. Nothing in this room falls forever -- there is no pit and no void anywhere, so a missed rail or launch costs you height and a walk back, never the level. That was a hard requirement and it is met.

HALL / VIEW 5 OF 18

The west gallery, at 11 m

WHERE YOU ARE

On the west gallery, 11 m up, with the first climb behind you.

WHAT YOU ARE LOOKING AT

The middle height of the room, and the back wall the second stair climbs.

THE ROUTE

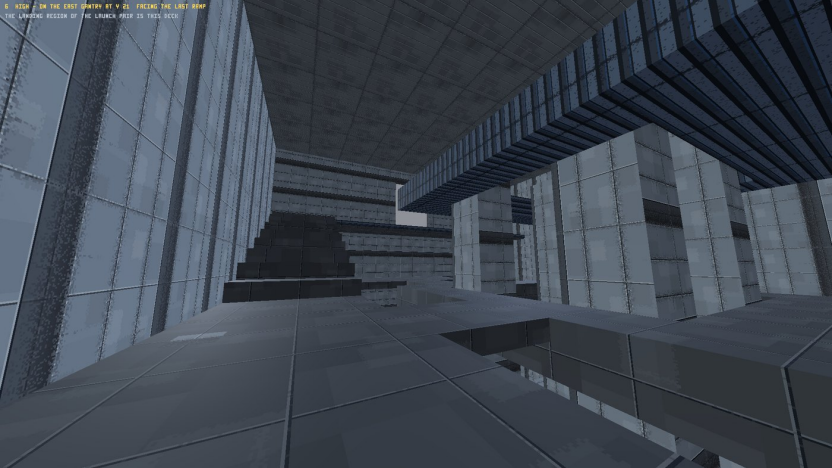

You got here up thirteen steps from the floor. The next stair leaves from the far end of this gallery and goes up to the landing at 21.

OFFERS

The rail passes overhead; nothing lands on this gallery. It is a walking floor, on purpose -- one of the four heights has to be plain.

MY CALL

Approve.

HALL / VIEW 6 OF 18

The east gantry, facing the last climb

WHERE YOU ARE

On the east gantry, 21 m up, one flight short of the exit.

WHAT YOU ARE LOOKING AT

The final staircase, eight steps up to the exit platform at 28.

THE ROUTE

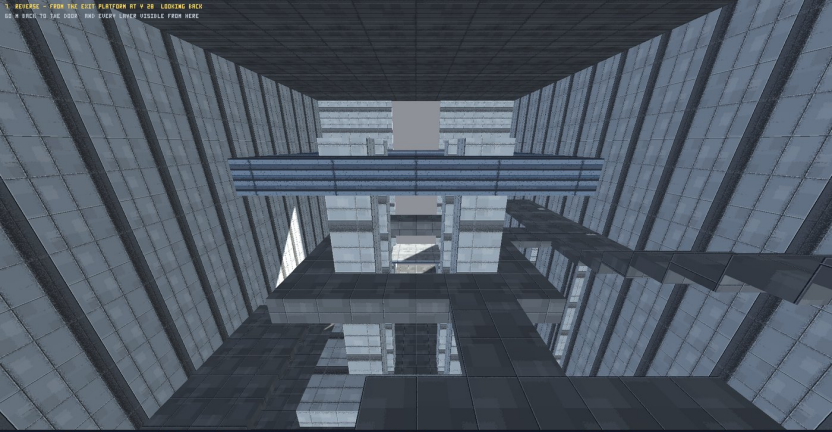

Gantry, stair, exit. This is the last leg.

OFFERS

This gantry is the LANDING pad of the launch pair -- a 3.5 m circle. A player with the launch package arrives here straight off the basin floor and skips everything between.

MY CALL

Approve. This is the clearest example in the library of an offer that shortens a route without replacing it.

HALL / VIEW 7 OF 18

From the exit, looking back

WHERE YOU ARE

On the exit platform, 28 m up at the far end -- the destination.

WHAT YOU ARE LOOKING AT

The whole room from the other end. Compare it with page 1: the same space, and the door you came in by is visible from here.

THE ROUTE

Everything you just climbed, in reverse.

OFFERS

The rail's high end is just above and behind.

MY CALL

Approve. The room reads from both ends, which is what makes it a transit hall rather than a cul-de-sac with a view.

HALL / VIEW 8 OF 18

Straight up the shaft

WHERE YOU ARE

On the basin floor, dead centre under the landmark, looking straight up.

WHAT YOU ARE LOOKING AT

The 12 m open shaft through the middle of the machine -- three rings, floor to 30 m, then roof at 38.

THE ROUTE

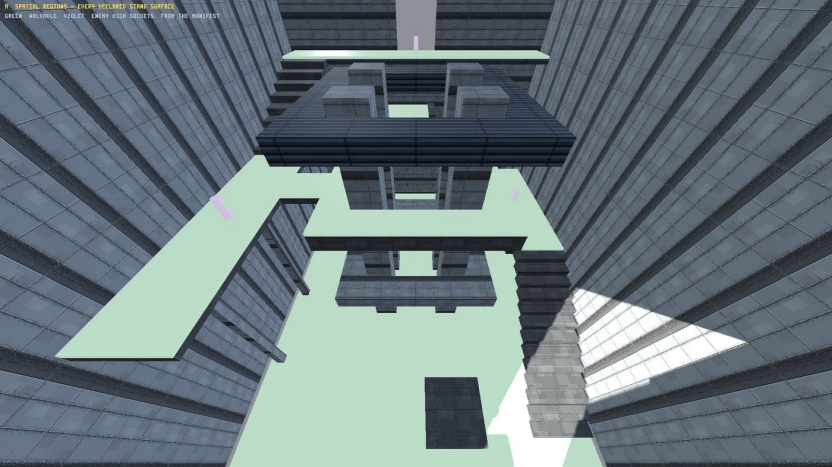

Nothing goes up here on foot, deliberately. This column of air is kept clear.

OFFERS

It is reserved as a vertical-movement volume: any future lift, updraught or moving platform wants this space, and nothing is allowed to be built in it.

MY CALL

Approve as a reservation. This is also the space I most want a grapple anchor to serve -- see page O5.

HALL / DIAGRAM A OF 6

Every place you can stand

WHERE YOU ARE

An overhead diagram, not a photograph. It is built from the shipped data rather than drawn over a render, so it cannot quietly disagree with the room.

WHAT YOU ARE LOOKING AT

All twelve declared stand surfaces as green plates at their true sizes and heights, with the five raised enemy positions as violet posts.

THE ROUTE

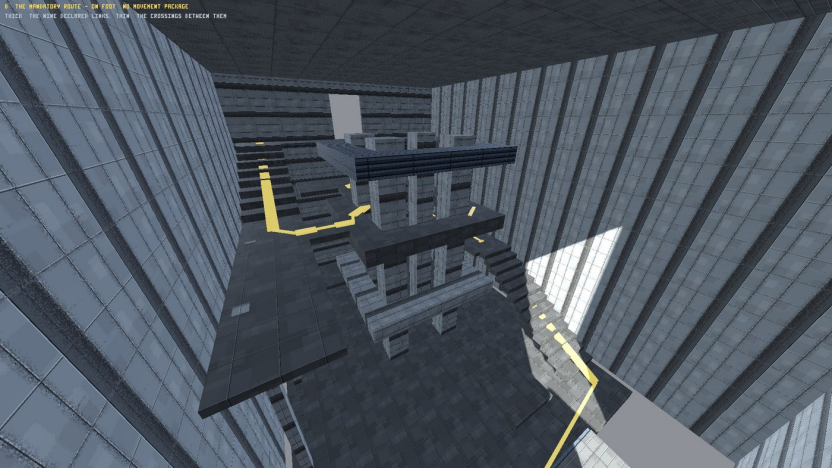

Not shown here -- see the next page.

OFFERS

Not shown here.

MY CALL

Approve. Twelve distinct places to stand, well under the limit of thirty-two, and they are different sizes at four different heights rather than one floor chopped up.

HALL / DIAGRAM B OF 6

The route on foot

WHERE YOU ARE

Overhead diagram.

WHAT YOU ARE LOOKING AT

The eleven declared route segments that get you from the door to the exit with no movement package installed at all.

THE ROUTE

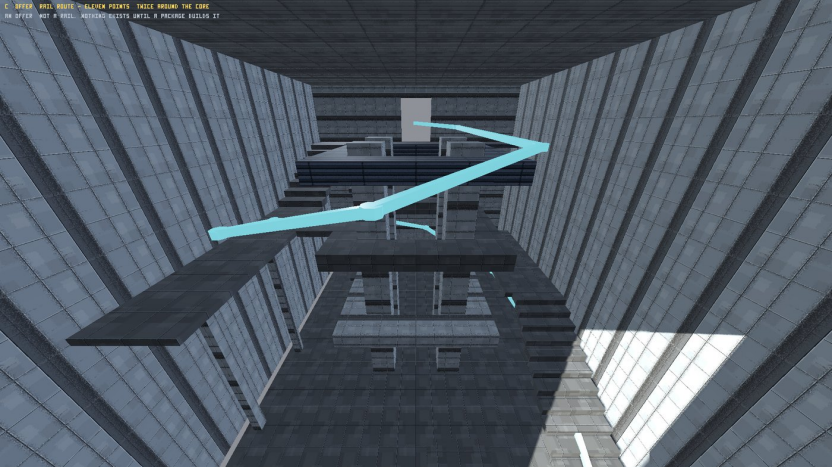

Every one of the twelve is a *walk* -- continuous ground the whole way. Nine are mandatory; three are optional circulation around the landmark. There is no point in this room where the only way forward is a mechanic you might not have.

OFFERS

Nothing here is an offer. That is the point of this diagram.

MY CALL

Approve -- this is the updated figure. The walkway around the landmark used to be a C: the south collar was a dead end you doubled back out of. ring_s_to_ring_e closes it, and it needed no geometry, because the east band already covered the south-east corner and only the declaration was missing.

HALL / DIAGRAM C OF 6

The rail

WHERE YOU ARE

Overhead diagram.

WHAT YOU ARE LOOKING AT

The reserved rail route: eleven control points, 143.9 m, climbing from head height to 31.5 m, twice around the landmark.

THE ROUTE

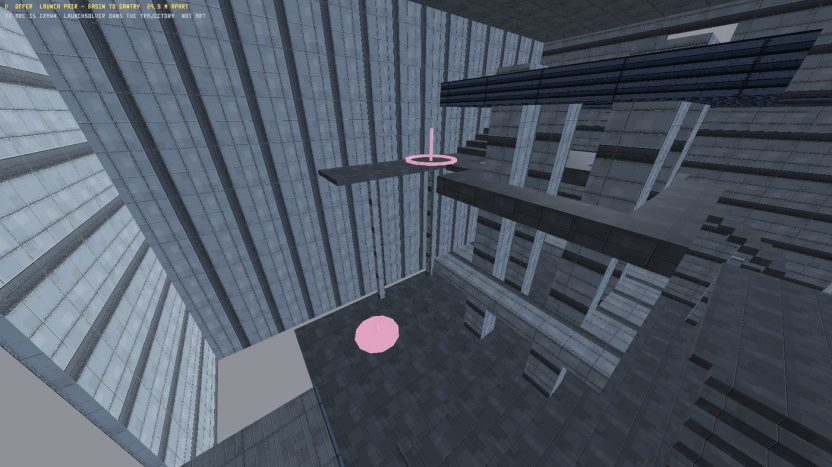

It shadows the walking route without replacing it -- same journey, one long ride instead of three staircases.

OFFERS

Art places sparse control points only. The smooth curve through them is Production's, so the ride can be tuned without re-authoring the room.

MY CALL

Approve. Two turns around a landmark is the single best thing in the room for a rail -- you keep seeing the same object from changing angles as you climb.

HALL / DIAGRAM D OF 6

The launch pair

WHERE YOU ARE

Overhead diagram.

WHAT YOU ARE LOOKING AT

Two pads: a filled disc on the basin floor you launch FROM, and an open ring on the east gantry you land ON, 24.5 m apart.

THE ROUTE

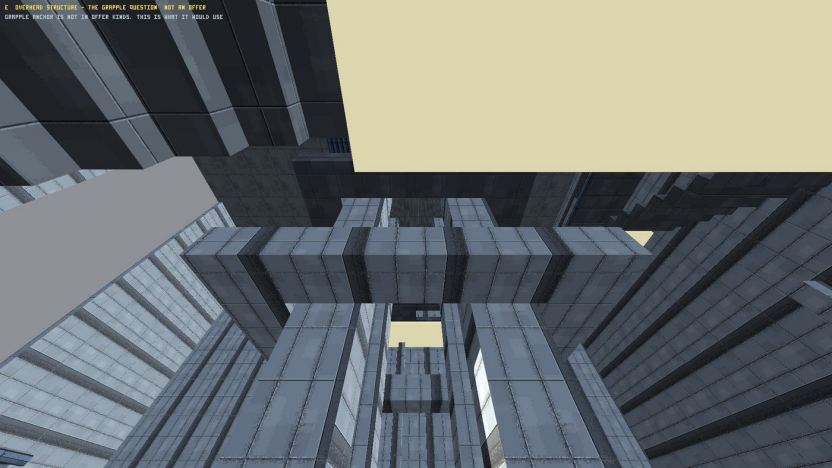

Taking it skips both lower staircases and the collar walk, dropping you one flight below the exit.

OFFERS

There is deliberately NOTHING drawn between the two pads. The game works out the flight from the two pads and gravity; if a curve were drawn here and the game disagreed with it, the drawing is what everyone would remember.

MY CALL

Approve.

HALL / DIAGRAM E OF 6

What a grapple would hang from

WHERE YOU ARE

Looking up from the basin floor.

WHAT YOU ARE LOOKING AT

The three grapple anchors, in orange, at the inner lip of each collar ring -- 9.2, 19.2 and 27.2 m up. The yellow marks overhead structure. The camera stands on the basin inside the landmark and looks straight up, which is the one view that shows all three.

THE ROUTE

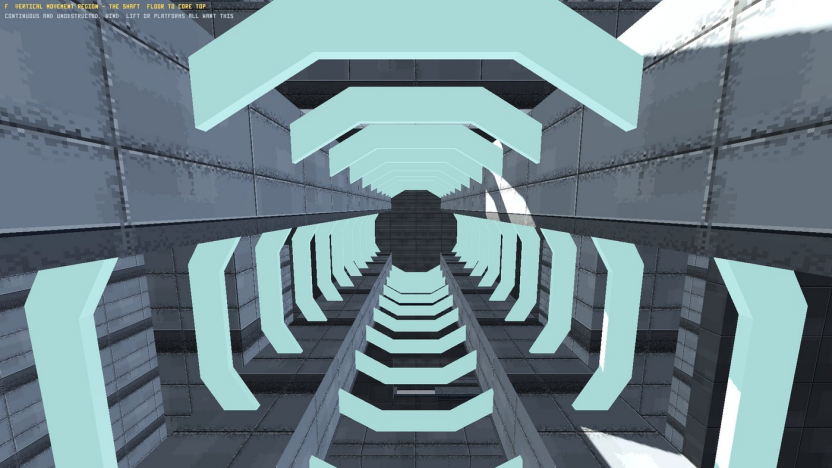

Not a route. Every one of these is optional; the walk from door to exit does not use them.

OFFERS

A place, not a reach. How far a player can throw or swing from one is Production's to decide -- drawing a circle of reach here would be the same mistake as drawing a launch arc.

MY CALL

Approve -- this is the updated figure, and the question it used to ask has been answered. The anchors moved once during the work: tucked under the bands they were legal and invisible, because a solid band hides what hangs beneath it. At the lip they read from the floor.

HALL / DIAGRAM F OF 6

The vertical movement volume

WHERE YOU ARE

Looking up the shaft from the basin.

WHAT YOU ARE LOOKING AT

The reserved column of air through the landmark, continuous and unobstructed from the floor to the top of the machine.

THE ROUTE

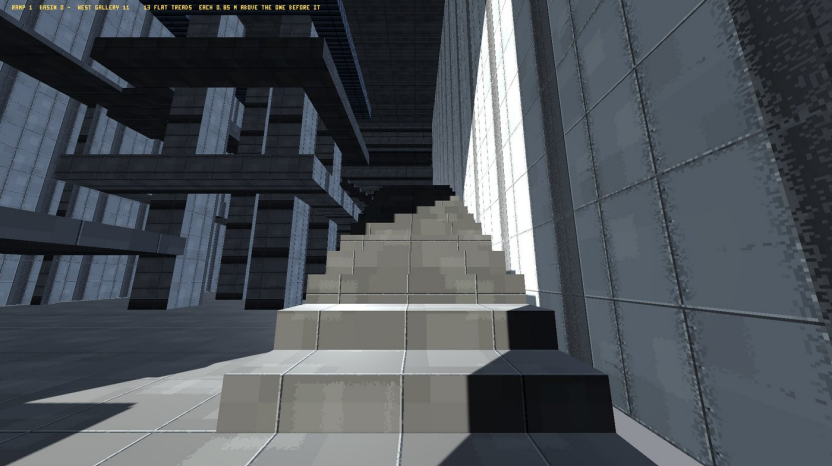

No walking route uses it.

OFFERS

It is a no-build volume held open for whatever vertical mechanic arrives -- a lift, an updraught, rising platforms. Reserving the space costs nothing now and cannot be recovered later if the room fills in.

MY CALL

Approve as a reservation. Nothing uses it yet and nothing needs to.

HALL / THE REPAIR / 1 OF 4

The first climb, rebuilt

WHERE YOU ARE

Standing on the basin at the foot of the west staircase, looking up it.

WHAT YOU ARE LOOKING AT

Thirteen flat treads climbing from the floor to the west gallery at 11 m. Until yesterday these were sloped wedges, and every one of them sloped the wrong way -- the ground fell away underfoot and then demanded a 1.4 m step up, which no player can make. Production caught it with a real player capsule; none of my own checks could, because they were all measuring bounding boxes and a box cannot see a slope.

THE ROUTE

The first climb of the mandatory route.

OFFERS

None. This is the plain way up, and it has to work before any offer is allowed to exist.

MY CALL

Approve. This is one of the two staircases Production refused. Measured off the collision triangles at 10 cm spacing, the worst real step is now 0.85 m against a 1.00 m limit.

HALL / THE REPAIR / 2 OF 4

The middle climb -- the one that was always fine

WHERE YOU ARE

On the west gallery at 11 m, at the foot of the back-wall staircase.

WHAT YOU ARE LOOKING AT

Twelve treads up to the north landing at 21 m. This flight was never refused, and it is here for comparison: it happened to run along the one axis where the old wedge maths came out right. Side by side with the page before, the two look the same now -- which is the point.

THE ROUTE

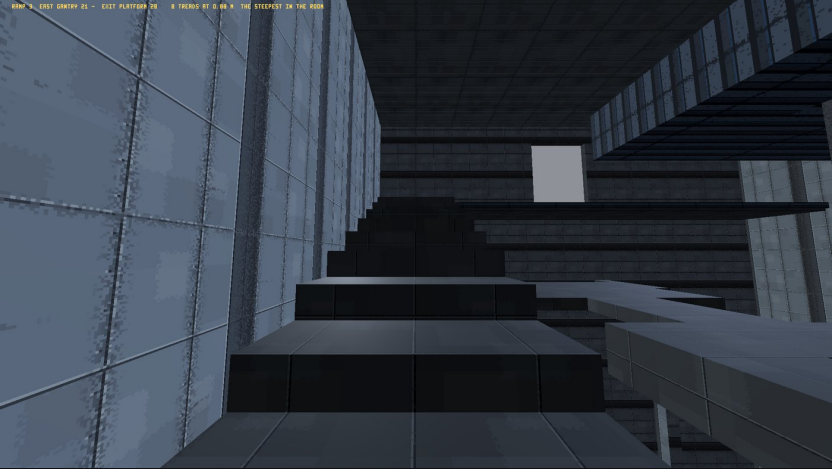

Second climb of the mandatory route.

OFFERS

None.

MY CALL

Approve. Worst real step 0.83 m.

HALL / THE REPAIR / 3 OF 4

The last climb, rebuilt

WHERE YOU ARE

On the east gantry at 21 m, at the foot of the final staircase.

WHAT YOU ARE LOOKING AT

Eight treads up to the exit platform at 28 m -- the steepest flight in the room. This was the second one Production refused.

THE ROUTE

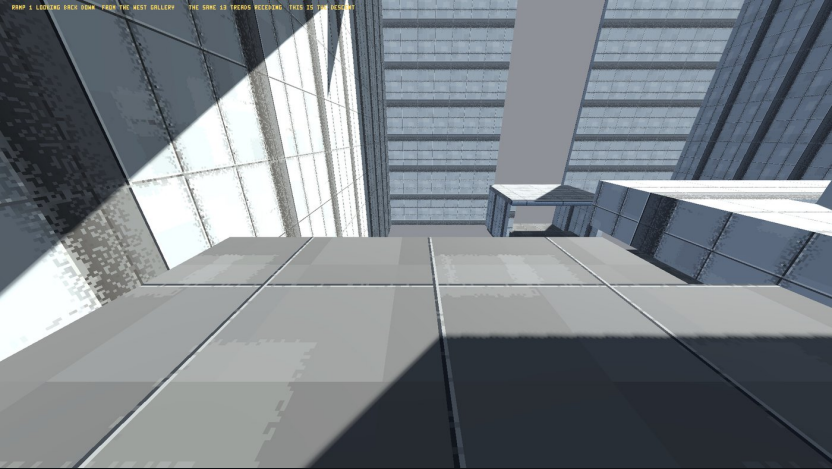

The last leg. It is also where a launched player rejoins the walking route.

OFFERS

The launch pad you would have landed on is behind the camera.

MY CALL

Approve. Worst real step 0.88 m -- the largest in the room, and still comfortably inside the limit.

HALL / THE REPAIR / 4 OF 4

The same stair, going down

WHERE YOU ARE

At the top of the west staircase on the gallery at 11 m, looking back down.

WHAT YOU ARE LOOKING AT

The same thirteen treads from page S1, receding to the floor. Worth its own page because a staircase is used in both directions and this is the one players will see most -- coming back down is what you do after you have been up.

THE ROUTE

The descent, and the retreat.

OFFERS

None.

MY CALL

Approve.

Plenum

SIZE

21.2 x 20.0 x 73.6 m

DECLARED

20 stand surfaces, 15 route segments (walk), 117 collision pieces

RAIL

13 control points, 129.4 m, y 4.0 to 66.4

LAUNCH

one pair, 28.1 m apart

GRAPPLE

3 anchor points

WHAT MAKES THIS ROOM DIFFERENT

A 72 m shaft, and the only room in the library where you arrive at the TOP and the whole room is the way down. The machine in the middle hangs from the ceiling and never reaches the floor -- it is suspended, not founded, which is the single detail that stops it reading as a tower with a staircase round it. The walls do the walking: thirteen landings and twelve flights spiral down the inside face. Three collars branch off the machine as the only floors that are not the wall.

THE INTENDED ROUTE

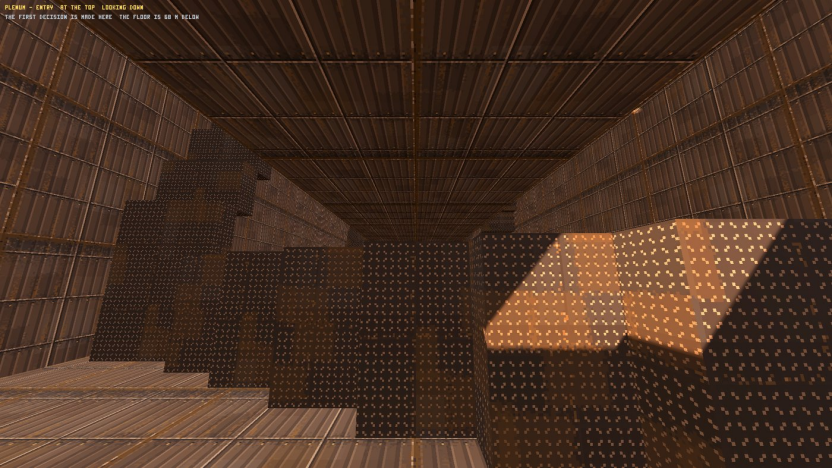

In at the top, 68 m up. Then down, and down, and down: twelve flights around the four walls, each dropping about 5.7 m, to the floor at zero. Three of the landings have a bridge out to a collar on the machine -- those are the only places you leave the wall, and they are optional detours rather than the route.

RAIL, LAUNCH AND GRAPPLE

A rail that runs the whole descent: 129.4 m of it, falling 62 m from top to bottom, which is more than twice the vertical range of any other rail in the library -- so the whole spiral has a fast alternative. A launch pair from the floor up to the middle collar, 28.1 m, which is the only way back UP that does not retrace the spiral. Three grapple anchors staggered up the shaft at 20, 38 and 56 m, roughly one per third.

WHAT I THINK WE SHOULD DO

Approve. This is the room that most aggressively proves the 'huge vertical space' idea and I would not change anything about its shape. The one thing to be aware of: the LOWEST collar's headroom is tight -- it passed the clearance check with 3 cm to spare -- so if anything ever hangs from a ceiling in this room, check that collar first.

PLENUM / VIEW 1 OF 4

Arriving at the top

WHERE YOU ARE

On the entry landing, 68 m up, looking down.

WHAT YOU ARE LOOKING AT

The full drop. The machine hanging in the middle of it, and the first of twelve flights leading away along the wall.

THE ROUTE

Down. There is no other direction from here, and that is the room's whole proposition.

OFFERS

The rail starts near the top of this shaft; the first grapple anchor is about a third of the way down.

MY CALL

Approve. Compare this with the Hall's page 1: one room hands you a horizon, the other hands you a hole.

PLENUM / VIEW 2 OF 4

From the floor, all 72 metres

WHERE YOU ARE

Standing on the floor at the bottom, looking up.

WHAT YOU ARE LOOKING AT

The whole shaft from below, and the machine hanging above you with nothing under it. This is the view that sells the suspension -- you can see daylight under a structure that is 56 m tall.

THE ROUTE

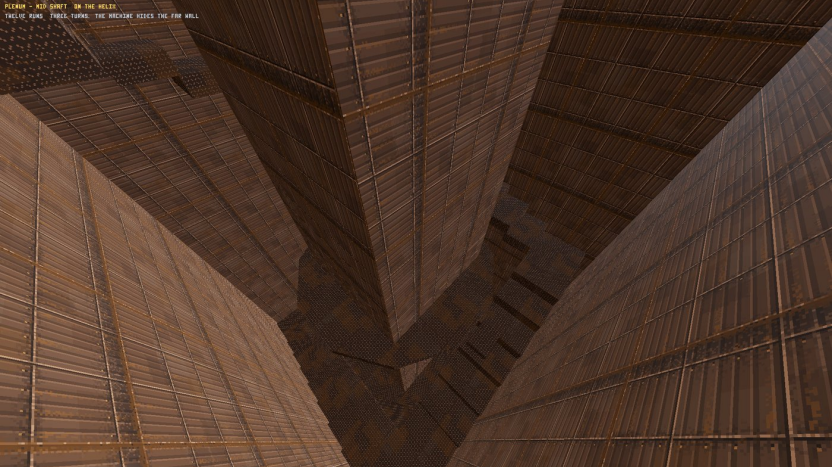

Where the spiral ends. Also where you start if the level runs the other way.

OFFERS

The launch pad is on this floor, aimed at the middle collar 28 m up -- the only quick way back up.

MY CALL

Approve. If you look at one page for this room, this is it.

PLENUM / VIEW 3 OF 4

Mid shaft, on the spiral

WHERE YOU ARE

About 40 m up, standing on the helix halfway down.

WHAT YOU ARE LOOKING AT

What the room is actually like to be in: a walkway with a wall on one side and a very long drop on the other, and the machine filling the view across the gap.

THE ROUTE

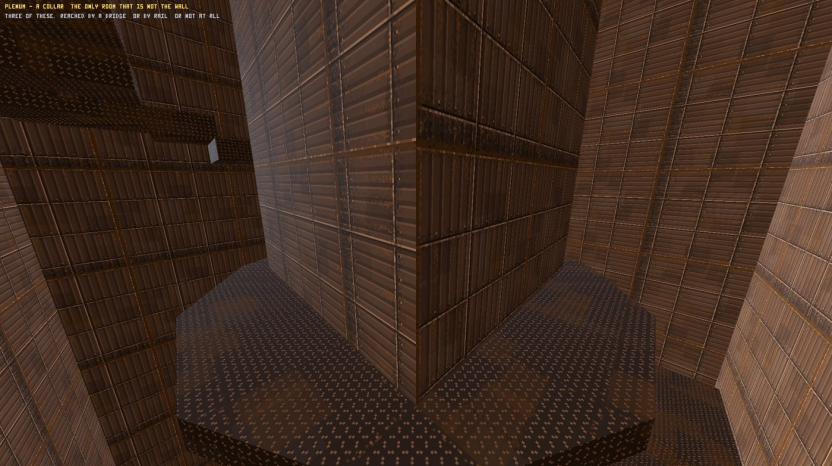

You are six flights in with six to go.

OFFERS

A grapple anchor sits out in the shaft at 38 m, close to here. The rail passes on the machine side.

MY CALL

Approve, with one flag for later: this is a lot of walkway with a lot of drop beside it, and it will want a railing language when dressing arrives. That is a decoration job, not a shell change.

PLENUM / VIEW 4 OF 4

A collar -- the only floor that is not the wall

WHERE YOU ARE

Out on one of the three collars, 30 m up, having left the wall by a short bridge.

WHAT YOU ARE LOOKING AT

A ring of floor around the hanging machine, with open shaft on both sides of you.

THE ROUTE

A detour, not the route. You come out, you go back. That is deliberate -- it makes the collars places you choose to be rather than places you pass through.

OFFERS

The middle collar is where the launch from the floor lands, so it is both a detour on the way down and a destination from the bottom.

MY CALL

Approve. The collars are the best thing in this room: they are the only moment the shaft stops being a corridor.

Yard

SIZE

85.2 x 52.0 x 17.6 m

DECLARED

6 stand surfaces, 5 route segments (walk), 39 collision pieces

RAIL

4 control points, 72.0 m, y 14.4 to 15.0

LAUNCH

one pair, 63.1 m apart

GRAPPLE

3 anchor points

WHAT MAKES THIS ROOM DIFFERENT

The wide one -- 84 m across and only 16 m tall, which makes it the exact opposite of the Plenum and the reason both exist. It is the one room where the main route never climbs at all: you can cross it end to end on flat ground. All the vertical interest is optional and hangs from one object, an 84 m gantry crane spanning the full width, with a catwalk ring below it on all four walls.

THE INTENDED ROUTE

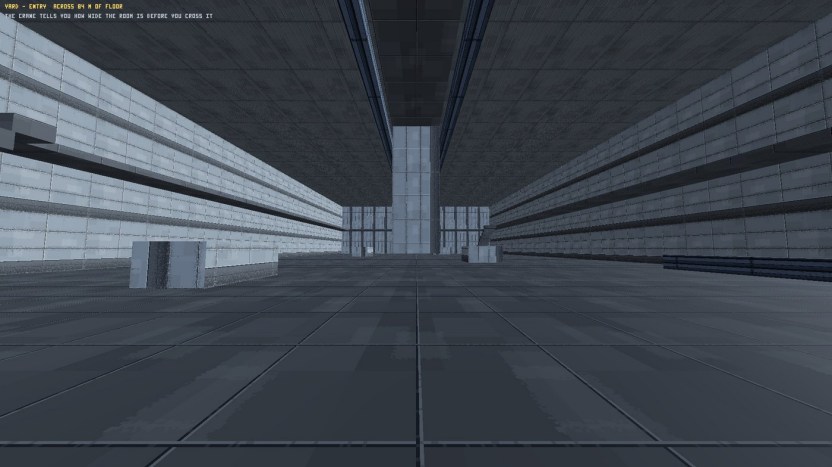

Straight across. In at one end, out at the other, 84 m of open floor between them and no climbing required. Two staircases in opposite corners go up to the catwalk at 8 m -- placed in corners on purpose so that going up is never the shortest way to anywhere. The catwalk is a choice, not a route.

RAIL, LAUNCH AND GRAPPLE

A rail that runs the crane itself -- level, 72 m, right across the room at 14 m. The longest launch in the library at 63.1 m, from the floor at the west end all the way to the catwalk at the east, which crosses the entire room in one shot. Three grapple anchors spaced along the crane at 10.6 m, so the crane is usable as a handhold as well as a rail.

WHAT I THINK WE SHOULD DO

Approve, but look hard at the height first. This is the flattest room in the library by a distance, and that is either exactly the contrast the set needs or one room too horizontal. I lean strongly toward keeping it -- a library where every room is tall is as monotonous as one where every room is a box -- but it is the cheapest thing to change now and the most expensive to change after Wave 2 copies the proportion.

YARD / VIEW 1 OF 4

Across 84 metres of floor

WHERE YOU ARE

At floor level at one end, looking the full length of the room.

WHAT YOU ARE LOOKING AT

84 m of open floor under a 16 m ceiling, with the crane spanning the width above you and the catwalk running the walls.

THE ROUTE

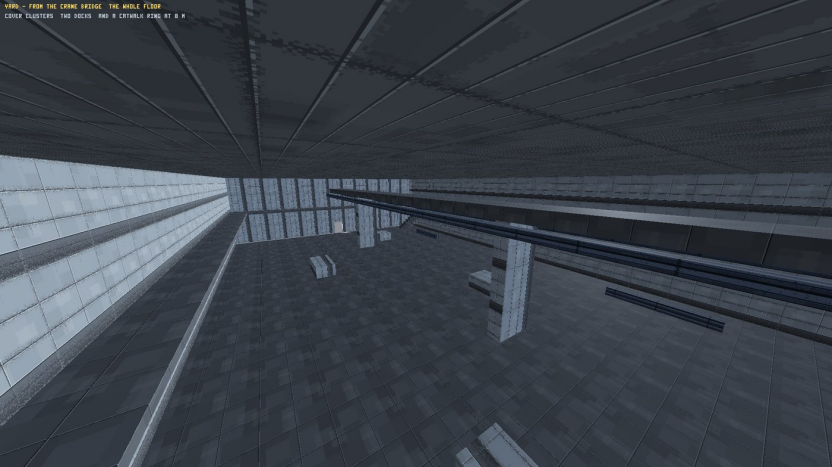

Dead ahead, on the flat, all the way. This is the only room in the library where that sentence is true.

OFFERS

The launch pad is on this floor, aimed at the far corner of the catwalk -- 63.1 m, the longest jump in the library.

MY CALL

This is the page to judge the height question from. My read: the horizontal is doing real work and the crane gives it a ceiling you notice. Approve -- but if it reads as squat to you, say so now.

YARD / VIEW 2 OF 4

From the crane, the whole floor

WHERE YOU ARE

Up on the crane bridge at 13.5 m, near the ceiling.

WHAT YOU ARE LOOKING AT

The whole floor at once. In a room this wide, height buys you information -- you can see where everything is from up here, which is exactly what a crane should be worth.

THE ROUTE

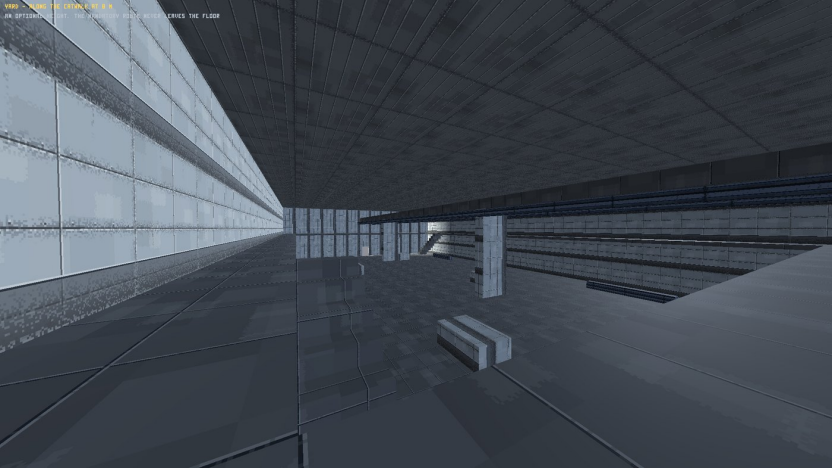

Nothing about the mandatory route comes up here. Everything up here is elective.

OFFERS

You are standing on the rail. The three grapple anchors are spaced along this same structure.

MY CALL

Approve. The second page for the height question -- this is what the ceiling buys.

YARD / VIEW 3 OF 4

Along the catwalk at 8 metres

WHERE YOU ARE

On the catwalk that rings all four walls, 8 m up.

WHAT YOU ARE LOOKING AT

The middle height of the room, and the way it frames the floor below.

THE ROUTE

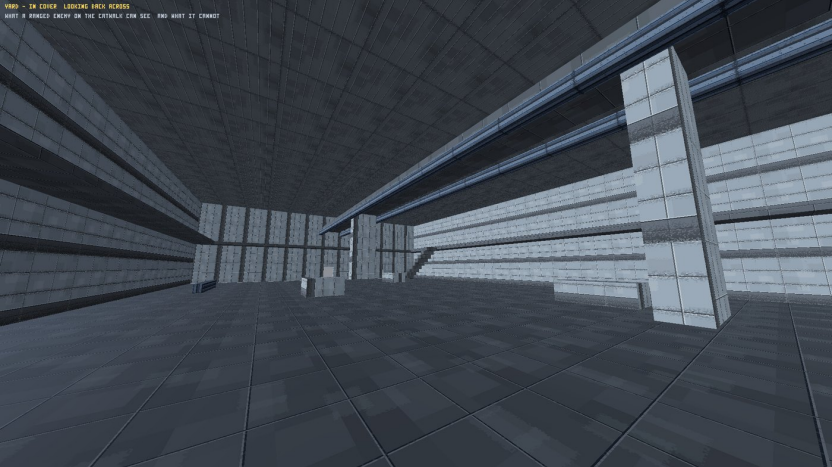

You got here up a staircase in a corner. The catwalk is continuous around all four sides -- unlike the Hall's collar, this loop actually closes, which is what I want fixed in the Hall.

OFFERS

The far corner of this catwalk is where the long launch lands.

MY CALL

Approve. This is the shape the Hall's collar ring should be.

YARD / VIEW 4 OF 4

In cover, looking back

WHERE YOU ARE

Down on the floor behind cover, near one corner, looking back across the room.

WHAT YOU ARE LOOKING AT

The room from the position a player actually takes in a fight -- low, behind something, with a long sightline.

THE ROUTE

Off to one side of the crossing.

OFFERS

Nothing lands here. This is the part of the room that is deliberately plain, so that the crane reads as the one special object.

MY CALL

Approve. No enemies are placed and no encounter is authored -- what the room provides is the vocabulary: four cover positions on the floor, five raised positions on the crane and catwalk, and 84 m to retreat across.

Span

SIZE

31.2 x 90.0 x 23.6 m

DECLARED

6 stand surfaces, 5 route segments (drop/walk), 54 collision pieces

RAIL

5 control points, 82.9 m, y 2.5 to 9.4

LAUNCH

one pair, 22.5 m apart

GRAPPLE

3 anchor points

WHAT MAKES THIS ROOM DIFFERENT

The long one -- a single 90 m deck on two pylons, with a fully walkable basin underneath all of it. It is the only room in the library with TWO complete routes over the same ground at two different heights, and the only one where you can commit from the upper to the lower and not get straight back. Everything about it is about that choice: the top is fast and exposed, the bottom is slow and covered.

THE INTENDED ROUTE

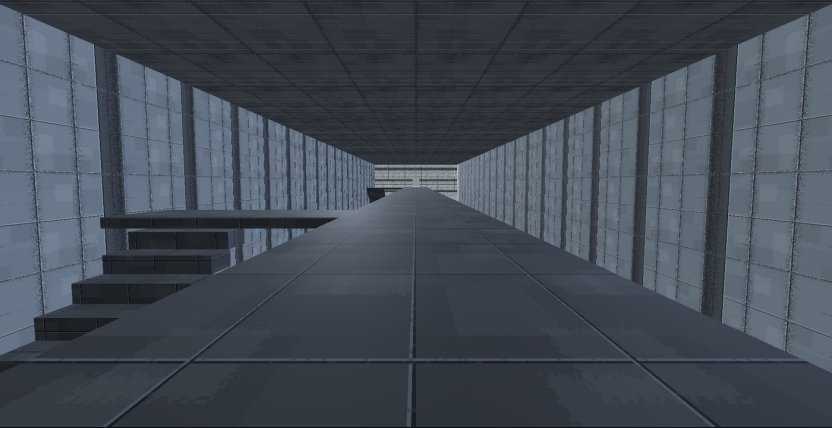

Two of them. On the deck: in one end, out the other, 90 m straight across at 14 m. In the basin: the same 90 m on the ground, with staircases at each end connecting the two. And in the middle of the deck there is a drop -- you can step off into the basin whenever you like, but the only ways back up are at the ends.

RAIL, LAUNCH AND GRAPPLE

The rail is slung UNDER the deck, not on it -- 82.9 m through the basin, so the fast line belongs to the lower route rather than the obvious upper one. A launch pair from the basin floor back up to the deck, 22.5 m, at the midpoint, which is the answer to the one-way drop. Three grapple anchors under the deck at 11.4 m, evenly spaced along the span.

WHAT I THINK WE SHOULD DO

Approve, and confirm the drop. The shape is my favourite in Wave 1 because it is the only room whose geometry poses a question to the player rather than a task. The one thing I want on the record is the one-way drop: I think making the descent free and the ascent cost something is exactly right, but it is a design call and it should be yours, not mine.

SPAN / VIEW 1 OF 4

On the deck, 90 metres of it

WHERE YOU ARE

At one end of the deck, 14 m up, looking the full length.

WHAT YOU ARE LOOKING AT

The upper route: one continuous deck running the whole room, on two pylons, with nothing either side of it.

THE ROUTE

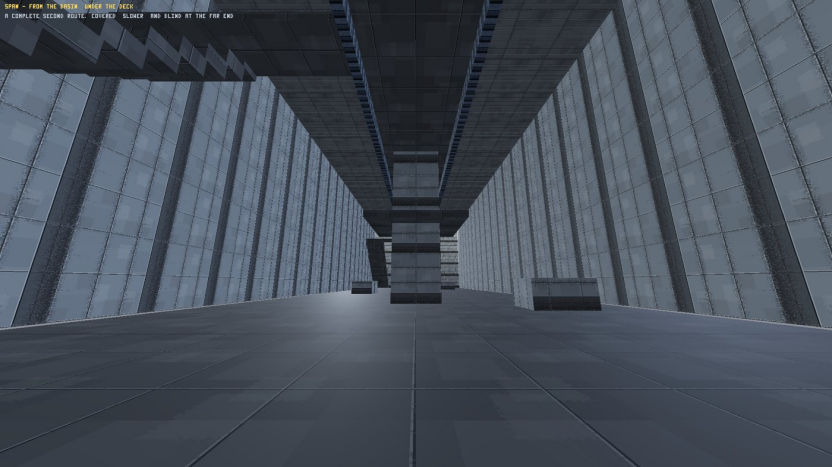

Straight across. This is the fast way and the exposed way -- there is nothing up here to hide behind.

OFFERS

None on the deck. Everything is underneath, which is the room's central joke: the interesting route is the one you cannot see from here.

MY CALL

Approve.

SPAN / VIEW 2 OF 4

From the basin, under the deck

WHERE YOU ARE

On the basin floor at ground level, under the span.

WHAT YOU ARE LOOKING AT

The lower route, and the underside of the deck 14 m above -- which is where the rail and all three grapple anchors are.

THE ROUTE

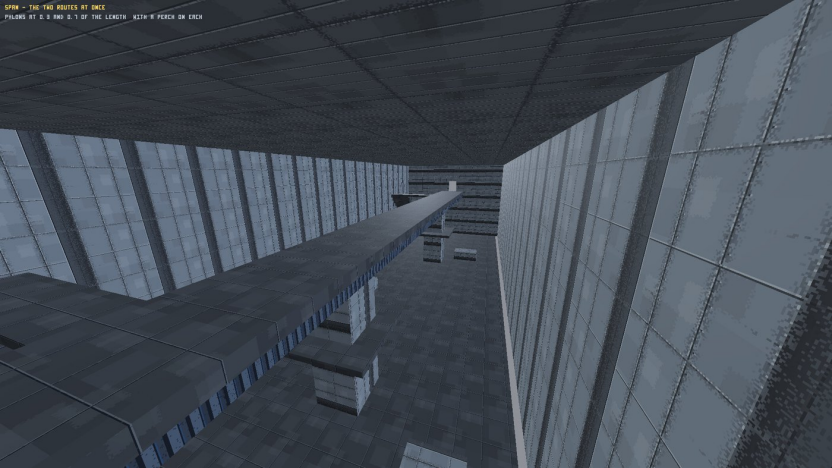

The same 90 m, on the ground, covered. Slower, and you cannot be seen from above.

OFFERS

All of them are here. The rail runs the length of this space; the launch pad in the middle throws you back up to the deck.

MY CALL

Approve. Putting the rail underneath rather than on the deck is the decision that makes the lower route worth choosing instead of just safer.

SPAN / VIEW 3 OF 4

Both routes at once

WHERE YOU ARE

Off to the side at 18 m, where both levels are visible together.

WHAT YOU ARE LOOKING AT

The whole proposition in one frame: deck above, basin below, both running the full length, both complete.

THE ROUTE

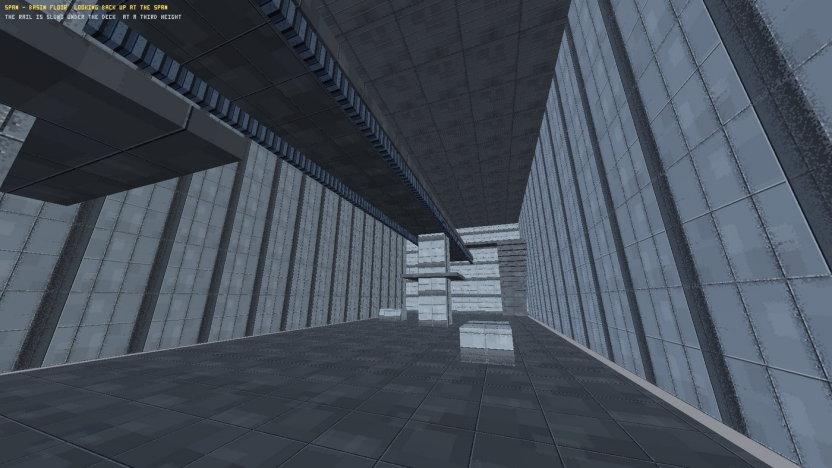

Either. And the drop in the middle of the deck that lets you change your mind once, in one direction.

OFFERS

The launch pair is the counterweight to that drop -- it is the only quick way from the lower route back to the upper one anywhere except the two ends.

MY CALL

Approve. This is the page that shows why the room exists.

SPAN / VIEW 4 OF 4

Basin floor, looking up at the span

WHERE YOU ARE

Down on the basin floor near one end, looking back up at the underside of the span.

WHAT YOU ARE LOOKING AT

How much structure is over your head, and how far it runs. The pylons are the only things touching the ground in the whole 90 m.

THE ROUTE

The staircase back up to the deck is at this end -- one of only two.

OFFERS

A grapple anchor is directly overhead.

MY CALL

Approve. This is the view that makes the one-way drop feel like a decision rather than a mistake: from down here you can see exactly how far it is to the next way up.
